Critical Care Nephrology

Webinar Series on Dose, Dialytrauma and Sustainability in CRRT

The **vision** behind the **International Society of Critical Care Nephrology (ISCCN)** is to improve the profile of Critical Care Nephrology as a speciality across all ages and promote the discipline through public advocacy, fostering networking, and acting as a hub for information sharing. This will lead to career opportunities and mentoring, as well as leadership training and professional development.

Therefore we are delighted to present a series of Webinars discussing **CRRT Dose** in relation to **Dialytrauma**, **Dynamic Dosing** and **Sustainability**.

Concluding session

Tuesday, May 26th – 10.00 CEST (09.00 UK)

CRRT : Sustainable Practice and Prescribing

Emerging evidence suggests that higher doses of Continuous Renal Replacement Therapy (CRRT) may cause harm rather than improve outcomes and **impact the waste generated** in Critical Care.

During the first two Webinars of this series, Emily See explained the concept of dialytrauma and dose and Chris Kirwan discussed adapting dose to optimise therapy.

For the third and final part of this series, join **Dr Bairbre McNicholas** (University of Galway) discussing CRRT Sustainable Practice and Prescribing and the relevant factors that can be considered.

Read more and Register **here** or via **the QR code** to join Bairbre McNicholas on May 26th

This is the concluding session of this webinar series.

All sessions will be available on www.isccn.org/webinar where you can already catch up on the first two webinars.
